**Manning River Catchment
Surface Water Quality Assessment**

1. Introduction

Parsons Brinckerhoff has been commissioned by AGL Upstream Investments Pty Ltd (AGL) to undertake surface water sampling and analysis to characterise the water quality within the Manning River catchment downstream of the Stage 1 Gas Field Development Area (GFDA) of AGL's Gloucester Gas Project (GGP), NSW. Five locations were sampled during two separate events: May 2014 and July 2015. Sampling locations, representative of downstream reaches, were chosen based on ecosystem types; freshwater, estuarine and marine. Samples were analysed for a range of physical and chemical parameters and the following report presents a summary of the surface water quality sampling program.

2. Catchment description

2.1 Manning River catchment

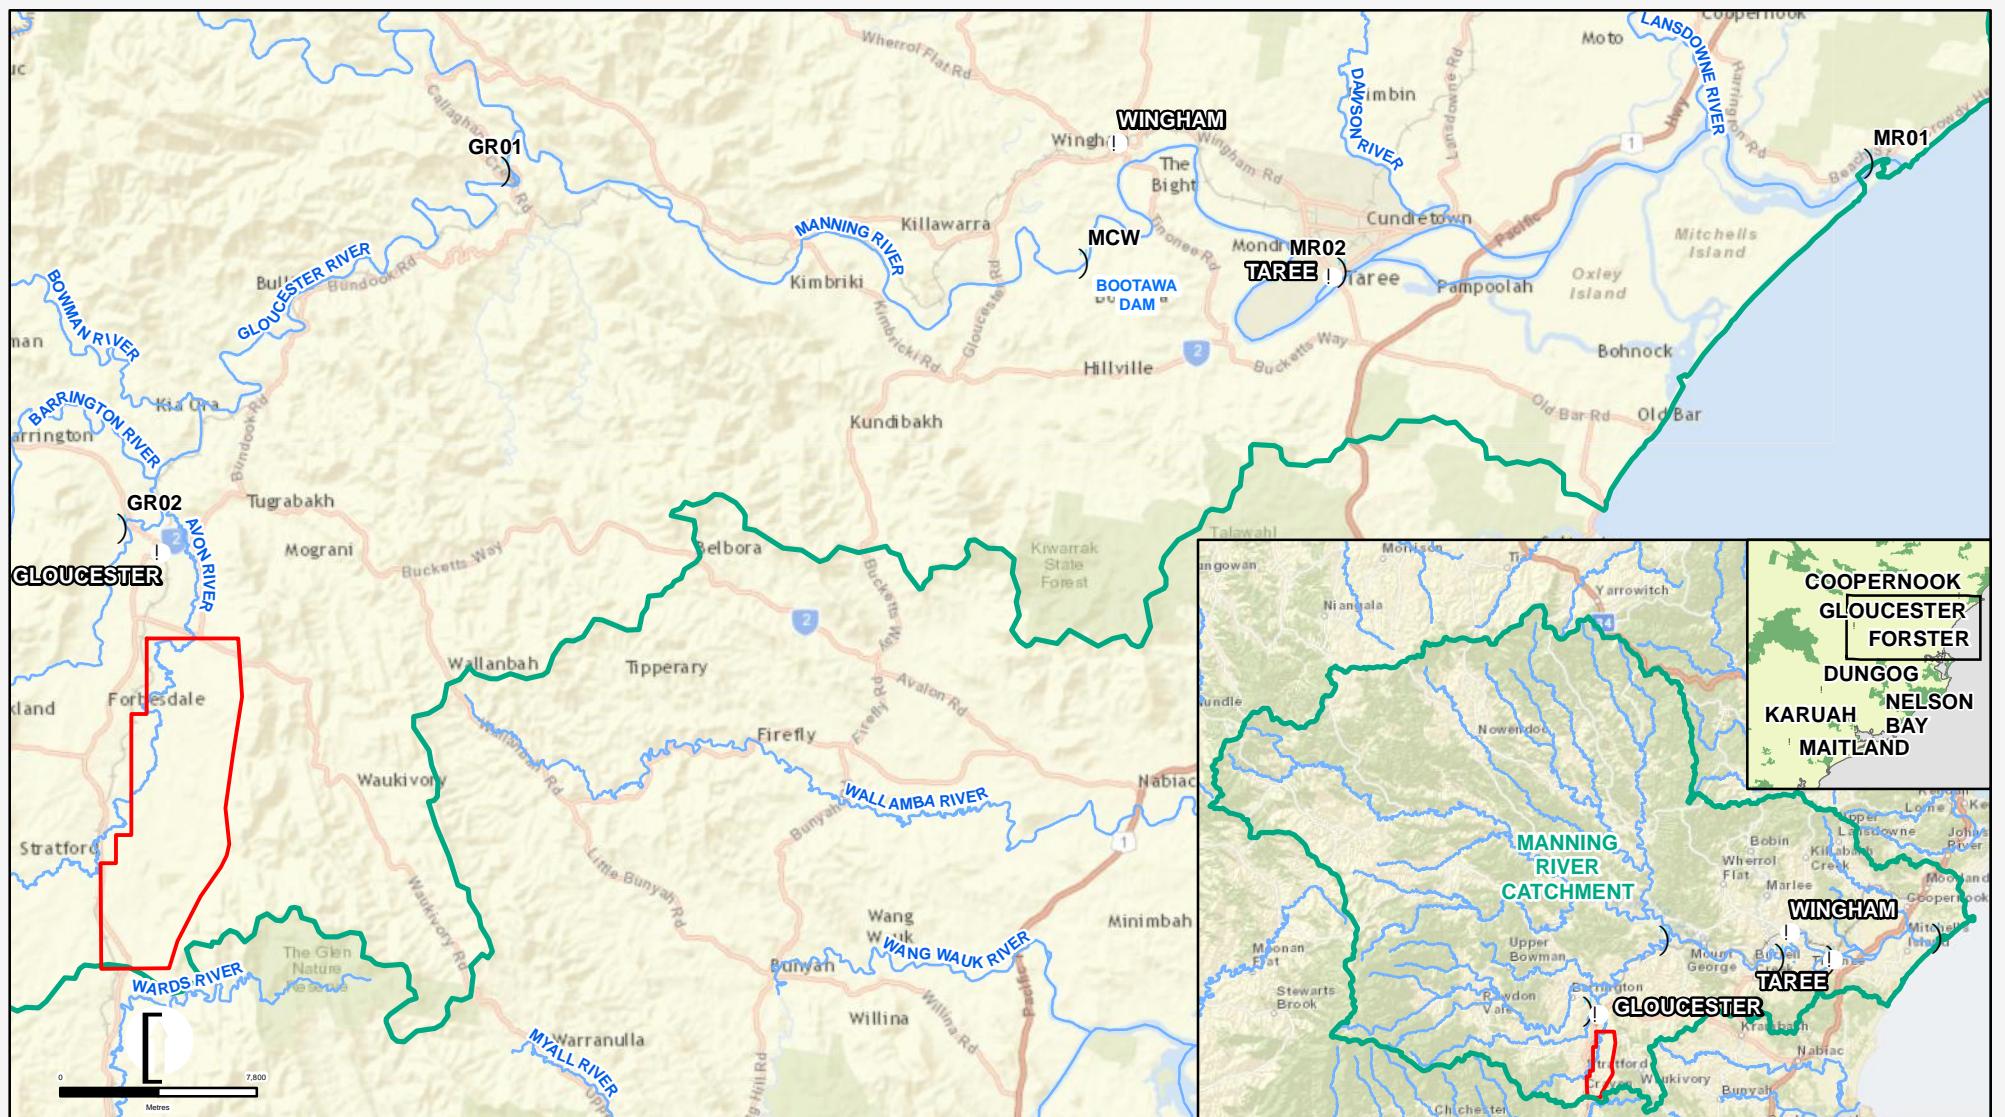

The Manning River catchment is located on the NSW mid-north coast (Figure 2.1). Bordered to the north-east by the Hastings catchment, to the north by the Macleay catchment, to the north-west by the Namoi catchment, south-west by the Hunter, and to the south by the Karuah catchment. The Manning River Catchment area is approximately 8,420 km². The major urban areas that lie within the Manning River catchment include Taree, Wingham and Gloucester (NOW 2013).

The Manning River has an average annual discharge to the sea of 2,530,000 ML (DWE 2009). The major tributaries of the Manning River catchment flow in a south-easterly direction through alluvial valleys before entering the Manning River which traverses the coastal riverine plains. The Manning River splits into two channels downstream of Taree, the southern arm flows into the Pacific Ocean at Old Bar, and the northern arm is joined by the Dawson and Lansdowne Rivers, flowing into the Pacific Ocean at Harrington. In the lower reaches, the river is tidal and is often saline to Abbotts Falls (near Wingham). Approximately 22% of the catchment is heavily timbered and is managed by NSW State Forests. Most of the forested areas are located on relatively steep slopes (NOW 2013).

2.2 Surface hydrology of the Gloucester Basin

The Stage 1 GFDA of the GGP is located within the north of the Gloucester Basin. The Basin is a narrow, north-south trending, elongated basin approximately 40 km long and 10 km wide, extending from Gloucester in the north to Stroud in the south.

A surface water divide is located to the south of the Stage 1 GFDA dividing surface water flow between the Wards River catchment (a sub-catchment of the Karuah River catchment) to the south and the Avon River catchment (a sub-catchment of the Manning River catchment) to the north. Surface water flows within the Stage 1 GFDA discharge to the Avon River which flows to the north through the Stage 1 GFDA joining the Gloucester River in the north of the Gloucester Basin at Gloucester. Further downstream, the Gloucester River joins the Manning River upstream from the town of Mount George.

3. Water quality monitoring

3.1 Water quality sampling locations

Five locations were chosen to collect surface water samples to characterise the water quality in the Manning River catchment downstream of the Stage 1 GFDA of the GGP. The sampling locations chosen provide spatial representation within the catchment and are representative of the different water quality characteristics within the catchment (freshwater, estuarine (tidal) and marine) (Figure 2.1). Details of the sampling locations are provided in Table 3.1.

Table 3.1 Manning River catchment sampling locations

River	Location	Coordinates	Description ¹
Gloucester River	GR01	416048 6473010	Shallow reach of river (approx. 300mm deep), upstream of the Avon River confluence in Gloucester. Samples were taken from the public reserve upstream of Thunderbolts Way bridge.
	GR02	400834 6458855	Shallow reach of river (approx. 500mm deep) upstream of the confluence with the Manning River, near Bundoora. Samples were taken beneath the Noel Devenish Memorial Bridge on Callaghans Creek Road.
Manning River	MCW	438958 6469375	Manning River upstream of the Abbotts Falls tidal limit (near Wingham). Samples were collected from MidCoast Water Bootawa Dam offtake on the Manning River.
	MR01	470116 6473322	Coastal inlet to the Manning River at Harrington. Samples were collected from the breakwall along the Manning River northern inlet.
	MR02	449212 6468980	Manning River estuarine reach downstream of the Abbotts Falls tidal limit. Samples were collected from a public pontoon at Queen Elizabeth Park, Taree.

(1) Photos of each monitoring location are shown in Attachment 1

3.2 Sampling methodology

Surface water samples for water quality analysis were taken from the river bank using a telescopic sampler to avoid compromised samples from river bank effects in order to be representative of water quality conditions at the time of sampling. Water quality physico-chemical parameters (pH, EC, TDS, DO and ORP) were measured at the time of sampling using a multi-parameter hand-held water quality meter. Water quality samples were collected in accordance with Parsons Brinckerhoff standard operating procedures (Parsons Brinckerhoff, 2015).

Samples were analysed for a broad chemical suite designed specifically to assess water quality. The analytical suite is shown in Table 3.2.

Table 3.2 Analytical suite

Category	Suite of analytes	
Field parameters	Electrical Conductivity (EC) Total Dissolved Solids (TDS) Temperature	pH Redox potential (ORP) Dissolved oxygen (DO)
General parameters (lab)	EC TDS (measured)	pH Total suspended solids (TSS)
Major ions	Calcium Magnesium Sodium Potassium	Chloride Carbonate Bicarbonate Sulphate Fluoride
Dissolved metals and minor/trace elements	Aluminium Arsenic Barium Beryllium Boron Bromine Cadmium Chromium Cobalt Copper Iron	Lead Manganese Mercury Molybdenum Nickel Selenium Strontium Uranium Vanadium Zinc
Other analytes	Total organic carbon (TOC) Silica	
Nutrients	Nitrate ¹ Nitrite ¹ Total nitrogen	Ammonia ¹ Total Kjeldahl Nitrogen Reactive and total phosphorus
Dissolved gases ¹	Methane	
Hydrocarbons ¹	Phenolic compounds Polycyclic aromatic hydrocarbons (PAH) Total petroleum hydrocarbons (TPH)	Benzene, toluene, ethyl-benzene and xylenes (BTEX) Volatile organic compounds (VOC's)

(1) Only analysed during the 2015 monitoring event.

3.3 Water Quality Guidelines

Water quality samples have been compared to relevant ANZECC (2000) guidelines for freshwater, estuarine and marine water. ANZECC (2000) guidelines provide trigger values for physical and chemical stressors and toxicants.

The Gloucester River sampling locations (GR01 and GR02) and Manning River location (MCW) are situated in predominately rural locations, at elevations ranging from 95 to 180 mAHD. These monitoring locations have been characterised as 'slightly to moderately disturbed, lowland (<150 mAHD) freshwater systems' in accordance with ANZECC (2000) to ensure comparison against the most relevant guideline values. The Manning River sampling location at Taree (MR02) is estuarine, while the monitoring location at the mouth of the Manning River (MR01) is considered Marine for comparison against ANZECC (2000) guidelines.

3.3.1 Key water quality indicators

Key water quality indicators and related numerical criteria (default trigger values) selected from the ANZECC (2000) Guidelines, relevant to assessing and monitoring the health of aquatic ecosystems, are provided in Table 3.3.

Table 3.3 Key water quality indicators for assessing aquatic ecosystems

Ecosystem type	TP (mg/L)	TN (mg/L)	NOx (mg/L)	DO (%sat)	pH	Salinity ($\mu\text{S}/\text{cm}$)
Lowland River (GR01, GR02 and MCW)	0.025	0.35	0.04	85 - 110	6.5 – 7.5	125 – 2,200
Estuaries (MR02)	0.03	0.30	0.015	80 - 110	7.0 – 8.5	-
Marine (MR01)	0.025	0.12	0.005	90 – 110	8.0 – 8.4	-

Source: ANZECC (2000)

Notes: Water quality parameters not analysed have been removed from the table

Abbreviations; TN = Total Nitrogen; TP = Total Phosphorous; DO = Dissolved Oxygen; NOx = Oxides of Nitrogen

3.3.2 Toxicants

Toxicants is a term used for chemical contaminants that have the potential to exert toxic effects at concentrations that might be encountered in the environment (ANZECC 2000). ESdat Environmental Data Management Software was used to compare water quality samples with ANZECC (2000) trigger values for toxicants in freshwater (GR01, GR02 and MCW) and marine water (MR01). The 95% protection level is most commonly applied to ecosystems classified as slightly to moderately disturbed and has been used to compare against water quality samples (refer to water quality summary table). There are no trigger values for toxicants in estuarine water in the ANZECC (2000) guidelines, no direct comparisons have been made for toxicants at MR02.

4. Results and discussion

4.1 Monitoring program observations

Table 4.1 details field observations at the time of sampling.

Table 4.1 Monitoring program observations

Location	Date and time	Observations	Date and time	Observations
2014 monitoring program			2015 monitoring program	
GR01	30/5/2014 9:00 AM	Visible surface water flow. Clear water, river bed visible.	2/7/2015 8:20 AM	Visible surface water flow. Clear water, river bed visible.
GR02	29/5/2014 16:30 PM	Visible surface water flow. Clear water, river bed visible.	2/7/2015 9:40 AM	Visible surface water flow. Clear water, river bed visible.
MCW	30/5/2014 10:45 AM	Slow surface water flow. Water clarity >1 m. Water level 0.26 m on location stage board.	2/7/2015 11:10 AM	Surface water flow visible. Water clarity <1 m (overcast and cloudy). Water level 0.58 m on location stage board.
MR01	30/5/2014 12:30 PM	Falling tide. Surface water flow visible. Water clarity >3 m.	2/7/2015 12:25 PM	Falling tide (high tide 10:15 AM, 1.4 m). Surface water flow visible. Water clarity approx. 3 m.
MR02	30/5/2014 11:30 AM	Falling tide (from near high tide). No visible flow. Water clarity >3 m.	2/7/2015 13:20 PM	Run out tide (low tide 14:18 PM, 0.2 m). Water clarity >3 m. Water level below location stage board.

The following observations have been made following a comparison of water quality results against ANZECC (2000) recommended guidelines for key water quality indicators (Attachment 1):

- Total Phosphorus concentrations were below default trigger values for all corresponding ecosystem types.
- Total Nitrogen concentrations were below default trigger values for all corresponding ecosystem types with the exception of MR02 in 2014 (0.9 mg/L) and MR01 in 2015 (0.3 mg/L).
- Oxides of Nitrogen concentrations at GR01 in 2015 (0.09 mg/L) exceeded ANZECC default trigger values.
- Dissolved Oxygen (% saturation) concentrations were outside recommended guideline ranges in 6 out of 10 samples.
- Generally, pH was within recommended guidelines however pH levels above ANZECC (2000) maximum guidelines were recorded in 2014 at GR01 and MCW (8.14 and 7.84 respectively).
- Salinity concentrations were below ANZECC (2000) maximum guideline concentrations at all freshwater locations.

Dissolved metal concentrations were generally below detectable limits with the following exceptions:

- Aluminium concentrations exceeded recommended freshwater guidelines at GR01 in 2014 (0.24 mg/L).
- Copper concentrations exceeded recommended freshwater guidelines at GR01 in 2014 (0.002 mg/L).

The following parameters were assessed only during the 2015 monitoring round: phenols, hydrocarbons, BTEX and volatile organics. No concentrations above laboratory detectable limits were found for any of these parameters.

A summary table of water quality data is shown in Attachment 2 and the laboratory certificates of analysis (COA) are shown in Attachment 3.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. All pages of this report have been checked and approved for release.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

NATA Accredited Laboratory 825

Accredited for compliance with
ISO/IEC 17025.

Signatories

This document has been electronically signed by the authorized signatories indicated below. Electronic signing has been carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	Position	Accreditation Category
Ankit Joshi	Inorganic Chemist	Sydney Inorganics
Ashesh Patel	Inorganic Chemist	Sydney Inorganics
Celine Conceicao	Senior Spectroscopist	Sydney Inorganics
Hoa Nguyen	Senior Inorganic Chemist	Sydney Inorganics
Shobhna Chandra	Metals Coordinator	Sydney Inorganics

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.

LOR = Limit of reporting

^ = This result is computed from individual analyte detections at or above the level of reporting

- EG020: Bromine quantification may be unreliable due to its low solubility in acid, leading to variable volatility during measurement by ICPMS.
- EK067G/EK061G/EK062G: LOR raised for Total P, TKN and TN on sample ID(MR02) and (MR01 due to sample matrix.
- Ionic Balance out of acceptable limits for samples 4 and 5 due to analytes not quantified in this report.

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.

LOR = Limit of reporting

^ = This result is computed from individual analyte detections at or above the level of reporting

Ø = ALS is not NATA accredited for these tests.

- EG020: Bromine quantification may be unreliable due to its low solubility in acid, leading to variable volatility during measurement by ICPMS.
- EG020: LORs for particular sample(s) have been raised due to matrix interference(s).
- It has been noted that Reactave P is greater than Total P for various samples, however this difference is within the limits of experimental variation.
- This report has been amended as a result of a request to change sample identification numbers (IDs) received by ALS from Chris Richard on 4/1/2016. All analysis results are as per the previous report.
- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1,2,3,cd)pyrene (0.1), Dibenz(a,h)anthracene (1.0), Benzo(g,h,i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.
